Measured per-pair log-radius response

16–84% of pairs | 5–95% of pairs | Median | Mean ± case-bootstrap SE

$\Delta \ln r / \Delta g$ (per unit shear)

Intrinsic $e_\parallel$ (along applied shear)

Intrinsic $|e|$

Measured zero-leg $|\hat{e}|$

True R_e (arcsec)

Measured zero-leg flux radius (arcsec)

Blending response R_{blend}

True magnitude

Measured zero-leg magnitude

Sersic index n

1,120,160 matched galaxies; 40 held-out cases; true Re > 0.5 arcsec; detected and usable in both legs; no measured selection cuts.
Forward 0 → 0.05 along each pair's applied shear direction. 12 quantile bins; all finite values enter statistics.
Shading shows per-pair scatter, not uncertainty of the mean. Axes zoom to central values; full tails are retained in the saved table.
