Radius response versus directional ellipticity, split by galaxy properties

1,120,160 matched galaxies; 40 validation cases; true Re > 0.5 arcsec; both legs detected/usable; no measured selection cuts.
Curves: mean response in 12 common ellipticity bins; bars: 1 SE from 2,000 whole-case bootstrap resamples.
Colors split each property into quartiles (ties merged). Other properties are not held fixed; all finite responses, including tails, enter means.
